

## Smart Contract Tools Evaluation Papers.

Paper	Summary	Remark
1. ICSE 2020 Empirical Review of Automated Analysis Tools on 47,587 Ethereum Smart Contracts	<ul style="list-style-type: none"> <li>This paper analyses 9 existing smart contract evaluation tools.</li> <li>The developed an environment called SmartBugs that includes the 9 existing tools for contracts evaluation.</li> <li>In this paper, two different datasets are used to assess the efficacy of the existing tools from three aspects: Effectiveness, Production and Performance.</li> <li>One of the datasets contains 69 contracts with known vulnerabilities and the second dataset contains 47,518 contracts collected from OSS repositories.</li> <li>Its takes the authors about 564 days to run the tools on the datasets.</li> </ul>	<ul style="list-style-type: none"> <li>Using the SmartBugs, it is easier to run the selected tools on the same dataset.</li> <li>The dataset is available online</li> <li>The time taken to evaluate the tools on the dataset is too long (about 1.5 years)</li> </ul>
2. ISSTA 2021 Empirical Evaluation of Smart Contract Testing: What Is the Best Choice?	<ul style="list-style-type: none"> <li>This paper proposes four steps to evaluate existing smart contracts evaluation tools.</li> <li>The authors first collect a dataset containing several vulnerability characteristics.</li> <li>The dataset was evaluate on nine existing tools, 3 static analysis, 3 symbolic execution and 3 dynamic fuzzing tools.</li> <li>The authors qualitatively analyses each tool based on the types of vulnerability they can detect from the dataset.</li> </ul>	<ul style="list-style-type: none"> <li>The dataset is available online.</li> <li>The paper focusses on having an environment with uniform parameters for fair comparison.</li> </ul>
3. ISSTA 2020 How Effective are Smart Contract Analysis Tools? Evaluating Smart Contract Static Analysis Tools Using Bug Injection	<ul style="list-style-type: none"> <li>This paper propose a systematic approach to evaluate the smart contracts static analysis tools.</li> <li>The authors presents SolidiFI an automated approach.</li> <li>The authors injects bugs into contracts code and solidiFI test the generated bugs using static analysis tools to identify the bugs that the tools couldn't find.</li> <li>The authors used 6 existing tools to run the SolidiFI.</li> <li>The authors finds bugs that the existing tools couldn't detect despite their claims that they can detect such bugs.</li> </ul>	<ul style="list-style-type: none"> <li>Data and code available : <a href="https://github.com/DependableSystemSLab/SolidiFI">https://github.com/DependableSystemSLab/SolidiFI</a></li> <li>Inject bugs to code to target the false negatives results</li> </ul>
4. PRDC 2021 An Empirical Evaluation of the Effectiveness of Smart Contract Verification Tools	<ul style="list-style-type: none"> <li>This paper introduce a smart contract defect classification scheme based on the Orthogonal Defect Classification.</li> <li>The authors apply this classification scheme to a contract dataset, which has been extracted from multiple sources and holds different types of defects.</li> <li>Three tools were analyzed using the datasets to evaluate their performance on the fault detection.</li> </ul>	<ul style="list-style-type: none"> <li>Introduce classification scheme for contracts bugs.</li> <li>The nature of the bugs are not discussed in the paper</li> </ul>

## Open Questions

1. Several approaches are used to classify the vulnerability/bug, which of these classification schemes is the best?
  - a. What are the existing bug's classification schemes for smart contract?
  - b. What methods are used to classify the bugs?
  - c. Which of the classification schemes best characterized the bugs?
2. Which class of vulnerability is more severe and which tool can detect it better?
  - a. What are the bug's types?
  - b. What are the characteristics of the severe bugs?
  - c. Which of the existing tools can detect severe bugs?
3. To what extent the tools differs in reporting relevant vulnerabilities?
  - a. What is the performance of the tools in detecting bugs?
  - b. What types of bugs are the tools designed to detect?

## Task Overview
